Features at a glance

DDA-C, DDC, DDE

Digital Dosing™

The SMART Digital S generation DDA-C, DDC and DDE with powerful variable-speed stepper motor brings state-of-the-art technology to perfection. Combined expert knowledge and patented solutions set future standards. Traditional technologies, such as stroke length or stroke frequency adjustment with synchronous motor or solenoid drive, become a thing of the past.

Unique flexibility with only a few variants

The included click-stop mounting plate makes the pump more flexible. Three different positions are possible without using any additional accessories, such as wall brackets. Service and pump exchange can now be done easily by clicking the pump in and out of the mounting plate.

The control cube on the DDA-C and DDC pump can be lifted and turned easily into three different positions: front, left or right.

Modularity of the control cube, DDA-C

TM087120

TM041662

Modularity of the control cube, DDC

A turn-down ratio of up to 1:3000, a wide supply voltage range (100-240 V; 50/60 Hz), combined connection sets and other features reduce the models and variants to a minimum.

Precise and easy setting / usability and interaction

The operator can easily install the pump and set it to discharge exactly the quantity of dosing liquid required for the application. DDA-C has integrated bluetooth and can be used with the Grundfos GO application. In the display, the setting of the pump is read out directly, the flow is shown in ml/h, l/h, or gph.

The click wheel (turn-and-push) and the graphical LC display with plain-text menu in more than 25 languages make commissioning and operation intuitive. As the LCD is backlit in different colors, the pump status can be seen from a distance (traffic-light concept).

TM088254

TM048170

Display, DDA-C

Display, DDC

Thanks to a variety of operation modes, signal inputs and outputs, the pump can easily be integrated into every process.

Advanced process reliability

An intelligent drive and microprocessor control ensures that dosing is performed precisely and with low pulsation, even if the pump is dosing high-viscosity or degassing liquids. Malfunctions, caused by, for example, air bubbles, are detected quickly by the maintenance-free FlowControl system, and then displayed in the alarm menu.

The AutoFlowAdapt function automatically adjusts the pump according to the process conditions, such as varying backpressure. The integrated flow measurement makes additional monitoring and control equipment redundant.

Designed to save costs

In general, the investment for a dosing pump installation is low compared to its life cycle costs, including the cost of the chemicals. The following features make the SMART Digital S DDA-C, DDC and DDE pumps contribute to low life-cycle costs:

- no underdosing or overdosing due to high dosing accuracy and FlowControl
- longer maintenance intervals due to the universal chemical resistance of the full-PTFE diaphragm
- reduced energy consumption due to the state-of-the-art drive technology.

Three application-oriented type ranges

DDA-C is a high-end pump range for extended flow and pressure ranges with sensor-based FlowControl and measurement functions for challenging industrial applications such as the following:

- process water
- food and beverage
- ultrafiltration and reverse osmosis
- pulp and paper
- boiler feed water
- CIP (Cleaning-In-Place).

DDC is a user-friendly pump range with standard inputs and outputs for common applications like the following:

- drinking water
- waste water
- swimming pool water
- cooling tower
- chemical industry.

DDE is a low-budget pump range with basic functions including manual operation or control via PLC for OEM applications, for example:

- car wash
- irrigation.

2. Identification

Type key

The type key is used to identify the precise pump and is not used for configuration purposes.

[Level control](#)

Functional description

The electronically controlled variable-speed motor (stepper motor) of the DDA, DDC and DDE pumps provides optimum control of the stroke speed. The duration of each discharge stroke varies according to the capacity set, resulting in optimum discharge flow in any operating situation, while the duration of each suction stroke is constant. See the figure below.

The advantages are as follows:

- The pump always operates at full stroke length, irrespective of the capacity set, which ensures optimum accuracy, priming and suction.
- A capacity range of up to 1:3000 (turn-down ratio) results in less variants and spare parts
- Smooth and continuous dosing ensures an optimum mixing ratio at the injection point without static mixers.
- There is a significant reduction of pressure peaks, preventing mechanical stress on wearing parts, such as diaphragm, tubes, connections, resulting in extended maintenance intervals.
- The installation is less affected by long suction and discharge lines.
- Dosing of high-viscosity and degassing liquids (SlowMode) is easier.

The optimum dosing control shown below applies to any operation mode.

Relation between stroke-frequency adjustment and capacity

Control cube DDA-C and DDC

DDA-C and DDC pumps are supplied with front-mounted control cube. The position of the control cube can easily be changed by unfastening two screws, lifting the cube, turning it to the left or to the right, and fastening the screws again.

Two of three possible control cube positions, DDA-C

TM088140

Two of three possible control cube positions, DDC

TM069584

Operating elements, DDA-C

The pump operating panel includes a display and operating elements.
If the pump is operated via **Grundfos GO**, the operating elements are locked.

TM087635

Pos.	Description
1	Graphical LC display
2	Click wheel
3	Start/Stop key
4	100% key

Click wheel

The click wheel is used to navigate through the menus, and selecting and confirming settings.
Turning the click wheel clockwise moves the cursor clockwise on the display. Turning the click wheel counter-clockwise moves the cursor counter-clockwise.
If the pump is operated via the **Grundfos GO** app, the click wheel cannot be used for navigating through the menus. To be able to navigate through the menus again, turn the click wheel and disconnect from GO.

Start/Stop key

The **Start/Stop key** is used for starting and stopping the pump. It can still be used while the pump is operated via **Grundfos GO**.

100% key

If the 100% key is pressed for less than 1 second, the display returns to the **Idle screen**.
If the 100% key is pressed for longer than 1 second, the pump doses at maximum flow, regardless of the operation mode. The pump continues dosing for 5 seconds while the click wheel can be operated. This is useful for one-handed operation during processes such as start-up or de-aeration.
The 100% key is locked when the pump is operated via the **Grundfos GO** app.

Operating elements, DDC

The pump operating panel includes a display and operating elements.

7	Mechanical lock

Menu

The DDA-C and DDC dosing pumps feature a user-friendly plain-text menu. The menu consists of 4 tabs: Operation, Info, Alarm and Setup. During initial start-up, all menu texts appear in English. The menu can be set to other languages.

Menu overview (example of main menus), DDA-C

TM088274

Menu overview (example of main menus)

The menu text appears in more than 25 languages on a big graphical display, backlit in four different colors according to the traffic light concept.

Display	Fault	Pump status
White	-	Standby
Green	-	Running
Yellow	Warning	Standby
Red	Alarm	Standby

Operation modes

Manual control

The pump ensures constant dosing according to the quantity set in l/h or ml/h or gph by the click wheel. The pump automatically changes between the measuring units.

Setting range

Pump type	Setting range ³⁾	
	From [l/h ($\text{gph} \times 10^{-3}$)]	To [l/h (gph)]
DDA-C 7.5-16	0.0025 (0.7)	7.5 (2)
DDA-C 12-10	0.0120 (3.1)	12 (3.1)
DDA-C 17-7	0.0170 (4.5)	17 (4.5)
DDA-C 30-4	0.0300 (8)	30 (8)
DDC 6-10	0.0060 (1.5)	6 (1.5)
DDC 9-7	0.0090 (2.4)	9 (2.4)
DDC 15-4	0.0150 (4)	15 (4)
DDE 6-10	0.0060 (1.5)	6 (1.5)
DDE 15-4	0.0150 (4)	9 (2.4)

³⁾ When the SlowMode function is enabled, the maximum flow is reduced, see section SlowMode.

Related information

[SlowMode](#)

Pulse control

The pump doses in proportion to an external potential-free pulse signal, for example, from a water meter. There is no direct relation between pulses and dosing strokes. The pump automatically calculates its optimal speed to ensure that the required quantity is dosed for each incoming pulse.

For DDA-C and DDC:

The quantity to be dosed is set in ml/pulse. The pump adjusts its speed according to two factors:

- the frequency of external pulses
- the set quantity per pulse.

Setting range

Pump type	Setting range [ml/pulse]
DDA 7.5-16	0.0015 - 14.9
DDA 12-10	0.0029 - 29.0
DDA 17-7	0.0031 - 31.0
DDA 30-4	0.0062 - 62.0
DDC 6-10	0.0016 - 16.2
DDC 9-7	0.0017 - 16.8
DDC 15-4	0.0032 - 31.6

The frequency of external pulses is multiplied by the set quantity. If the product exceeds the maximum flow of the pump, a maximum of 65,000 pulses can be stored for later processing with the Memory pulse function, when activated.

For DDE-PR, DDE-P control variant:

The dosing quantity per pulse is adjusted with the adjustment knob according to a scale from 0.1 to 100 % of the stroke volume. The pump adjusts its speed according to two factors:

- the frequency of external pulses
- the set percentage of stroke volume.

Setting range, DDE-PR, DDE-P

Pump type	Setting range [ml/pulse]
DDE 6-10	0.0008 - 0.81
DDE 15-4	0.0016 - 1.58

Analog 0/4-20 mA control

This section applies to the DDA-C and DDC-AR control variant.

The pump ensures dosing according to an external analog signal. The dosed capacity is proportional to the input value in mA.

Operation mode	Input signal	Dosing capacity
4-20	$\leq 4.1 \text{ mA}$	0 %
	$\geq 19.8 \text{ mA}$	100 %
0-20	$\leq 0.1 \text{ mA}$	0 %
	$\geq 19.8 \text{ mA}$	100 %

The relation of the analog input value and the dosing flow, as shown in the table, can be set in the **Grundfos GO** app in **Advanced settings > Analog input border**.

TM041120

0/4-20 mA control

This section applies to the DDA-C.

With the **Analog scaling** function, the curve can be individually drawn between two arbitrary points: A (I_1/Q_1) and B (I_2/Q_2).

TM087861

Analog scaling with positive gradient

Pos.	Description
Q [l/h]	Dosing capacity
I [mA]	Input signal

Flow proportional

This section applies to the DDA-C.

The Flow proportional operation mode is ideal for dosing applications where a chemical must be added in proportion to the process flow rate (for example, drinking water) ensuring constant volumetric concentration even when the process flow varies. The process flow rate is measured using water meters with a pulse output or analog flow sensors with a 0/4-20 mA output.

In this operation mode, the pump doses a preset target volumetric concentration adjusting the dosing volume in proportion to the process flow rate. While the pump is running, the target volumetric concentration is shown in the upper area of the display and the actual volumetric concentration is shown below. The actual volumetric concentration is updated constantly (every 0.2 seconds). This allows for quick verification of the dosing accuracy.

In the Counter > Flow proportional menu, the following values are displayed as continuous counters:

- the volume of the dosed chemical
 - the volume of the process flow (for example, drinking water).
- Consumption from other operating modes is recorded separately via the total chemical counter. This ensures that the consumption values used for long-term analysis are not distorted by other operating modes of functions.

Batch

This section applies to the DDA-C.

In the Batch mode, the pump doses the set **Batch volume** in the set **Batch duration**. A batch is dosed every time the pump receives an external pulse or the Start/Stop key is pushed. If the pump receives new pulses before a batch is completed, these pulses are ignored.

If **Continue after interrupt** is activated, the pump stops dosing and goes to operating state "Ready" in the event of an interruption (**Alarm**, **External stop**). The remaining **Batch volume** and **Batch duration** are displayed. Once the interruption is resolved, the pump automatically continues dosing the remaining **Batch volume** in the remaining **Batch duration**.

If **Continue after interrupt** is deactivated, the pump stops dosing and the batch is reset in the event of an interruption. The remaining **Batch volume** is displayed. Once the interruption is resolved, the pump waits for the next trigger to restart with a new batch.

TM041105

Pos.	Description
V	Batch volume
I	Pulse
t	Time
t1	Batch duration

The setting range depends on the pump type. If the **SlowMode** is active, the setting range is reduced.

Type	Setting range per Batch		
	from [ml]	to [l]	Resolution ⁴⁾ [ml]
DDA-C 7.5-16	0.74	180	0.0925
DDA-C 12-10	1.45	288	0.1813
DDA-C 17-7	1.55	408	0.1938
DDA-C 30-4	3.10	720	0.3875

⁴⁾ Dosing quantities with a resolution of up to 1/8 of the dosing stroke volume can be dosed due to digital motor control.

Timer cycle

This section applies to the DDA-C.

In the **Timer cycle** mode, the pump doses the set **Batch volume** in regular cycles. A cycle starts after a **Start delay**.

TM041107

Pos.	Description
V	Batch volume
t1	Batch duration
t2	Start delay
t3	Cycle time

In the event of an interruption due to **Alarm** or **External stop**, the pump stops dosing and goes to operating state "Ready" while the **Timer cycle** continues to run. The remaining **Batch volume** and **Batch duration** are displayed. Once the interruption is resolved, the pump automatically continues dosing according to the actual timeline position.

In the event of a power interruption, the pump automatically starts a completely new **Timer cycle**, which begins with a **Start delay** as soon as the power is restored. If the pump is stopped, the **Timer cycle** is lost. A new **Timer cycle** is started when the pump is started.

Setting range

The batch volume setting range corresponds to the pulse-based batch control setting range.

Timer week

This section applies to the DDA-C.

In this operation mode, up to 16 dosing procedures can be defined for a week. These dosing procedures may take place regularly on one or several week days. For the **Batch volume** setting range, see section **Batch**.

Each dosing procedure consists of the following:

- **Weekly schedule**
- **Start time**
- **Batch volume**
- **Batch duration**
- **Active: On/Off.**

In case several procedures overlap, the procedure with the highest flow rate has the highest priority. Batch dosing stops during any interrupt, for example, power supply failure or external stop, while the time continues running in the background (real-time clock). After the interrupt ends, batch dosing proceeds according to the current status in the timeline.

TM041108

Example of a Weekly schedule

[Batch](#)

Functions

SlowMode

This section applies to the DDA-C and DDC.

When the **SlowMode** function (anti-cavitation) is selected, the pump extends and smooths its suction stroke. This results in a softer suction stroke.

The **SlowMode** function is used in the following situations:

- when pumping high-viscosity liquids
- when pumping degassing liquids
- when the suction line is long
- when the suction lift is high.

Depending on the application, the motor speed during the suction stroke can be reduced individually to approximately 50 % or 25 % of the normal motor speed.

The maximum pump capacity is reduced accordingly. See section Functional description for further details.

Related information

[Functional description](#)

Auto deaeration

This section applies to DDA-C.

If degassing media are dosed, air pockets can form in the dosing head during breaks in dosing. As a result, it is possible that no medium is dosed when the pump is restarted. The **Auto deaeration** function performs pump de-aeration automatically at regular intervals. Software-controlled diaphragm movements make the air bubbles rise and collect at the discharge valve so that they can be removed on the next dosing stroke.

The **Auto deaeration** function operates under the following conditions:

- if the pump is not in operating state "Stop"
- if no alarm is active
- during breaks in dosing, for example, **External stop** or no incoming pulses.

The **Auto deaeration** function can be activated or deactivated in the **Settings** menu.

The diaphragm movements can displace small volumes of dosing liquid into the discharge line. This is virtually impossible when dosing highly degassing media.

Calibration

This section applies to the DDA-C and DDC.

The pump is calibrated in the factory at the nominal pressure of the respective pump type. For the maximum pressure, see section Technical data for DDA-C and DDC. After start-up, the dosing pump can be calibrated for the actual installation to ensure that the displayed value (ml, l or gph) is correct. A calibration program in the setup menu facilitates this process. The **AutoFlowAdapt** function keeps the dosing precision (DDA FCM-C control variant), even if the backpressure changes. For the description of the **AutoFlowAdapt** function, see section **AutoFlowAdapt**.

[AutoFlowAdapt](#)

[Technical data, SMART S DDA-C](#)

[Technical data, SMART S DDC](#)

External stop

This section applies to the DDA-C, DDC, DDE-PR and DDE-P.

With the External stop function, the pump can be stopped from a remote place via an external contact. It is not recommended to switch on and off the power supply as it was usual when working with a conventional dosing pump. When working with microprocessor-controlled digital dosing pumps, the external stop signal has to be used to keep the optimal dosing precision and prevent damages to the electronics.

When activating the External stop signal, the pump changes from running to standby. The operation display shows an activated External stop. The signal input can be set to normally open (default) or normally closed contact.

Counters

This section applies to the DDA-C and DDC.

The pump displays resettable and non-resettable counters in the info menu tab.

Counter	Description	Resettable
Trip volume	Volume dosed from a container in liters or US gallons.	Yes
Total volume (DDA-C)	Accumulated dosed quantity in liters or US gallons	No
Operating hours	Accumulated number of operating hours (power-on)	No
Motor runtime	Accumulated number of motor runtime hours	No
Strokes	Accumulated number of dosing strokes	No
Power on/off	Accumulated number of times the mains supply has been switched on	No

Service display

This section applies to the DDA-C and DDC.

Due to the optimized construction and the smooth digital dosing principle, the service periods are more than twice as long as those of conventional pumps. However, the wear parts have to be exchanged at regular intervals to keep the dosing precision and process reliability at a high level. The service display in the pump shows when service of the wear parts is required. The displayed service kit product number makes service more convenient. The following information is presented in the Info display:

Display	Description
-	No service is required.
Service Soon	Order parts for service soon.
Now	Service must be performed now.
Service kit	8-digit Grundfos product number The service kits contain all parts needed for standard maintenance.
Reset service system	After performing the service, reset the system.

The following service messages appear, depending on what happens first:

Display	Motor runtime [h]	Regular intervals [months]
Service soon	7,500	23
Service now	8,000	24

In case of difficult liquids, the service intervals may be shorter and service has to be performed earlier.

Level control

This section applies to the DDA-C, DDC, DDE-PR and DDE-P.

The pump can be connected to a dual level control unit for monitoring the chemical level in the tank. The pump can react to two level signals:

Level sensors	Pump reaction ⁵⁾	
	DDA, DDC	DDE-PR, DDE-P
 Low-level signal	The display is yellow (Warning). The Low-level signal is flashing. The pump continues running.	The LED lights up in yellow. The pump continues running.
 Empty tank signal	The display is red (Alarm). The Empty tank signal is flashing. The pump stops.	The LED lights up in red. The pump stops.

⁵⁾ Depending on the pump model and settings, the relay outputs can be activated, see section Relay output.

Related information

[Relay output](#)

Tank volume sensorless

This section applies to the DDA-C.

The Tank volume sensorless function enables continuous monitoring of the remaining chemical volume in the chemical tank without the need for conventional level sensors such as radar or ultrasonic sensors. The function is particularly suitable for applications where such sensors cannot be used due to cost or space constraints. It is ideal for interchangeable chemical tanks, such as canisters, barrels or IBCs, where low installation costs, flexibility, and simplicity are essential.

Chemical tanks can be registered with the name of the chemical and the total added volume of the tank. a threshold for a low-level warning can be set. This setting helps to detect an almost empty chemical tank at an early stage and supports timely refilling or replacement.

The remaining volume is calculated by subtracting the dosed volume from the registered total added volume. The dosed volume is continuously tracked during operation.

- In the DDA FCM-C models, the dosed volume is measured by the integrated FlowControl function. The measurement accuracy is between ± 1 and ± 1.5 %.
- In the DDA AR-C models, the dosed volume is calculated based on the stroke volume and the dosing time.

For precise and reliable volume monitoring without external sensors, the use of a DDA FCM-C variant is recommended.

All registered parameters can be displayed in the Info > Tank monitoring menu.

The actual tank volume can be transmitted via Fieldbus or the Grundfos CONNECT Cloud. With Grundfos CONNECT, it is possible to monitor the tank volume remotely and receive notifications of low levels via text message or email.

The Days since reg. (Days since registration) values are useful for manual analysis of consumption patterns.

Relay output

This section applies to DDA-C, DDC-AR and DDE-PR.

The pump can activate 2 external signals by built-in relays switched via internal potential-free contacts. Depending on the process control requirements, the following relay output settings can be selected:

For the DDA-C and DDC-AR:

Signal		Description
Relay 1	Relay 2	
Alarm ⁶⁾	Alarm	The display is red, the pump stops (for example Empty signal).
Warning ⁶⁾	Warning	The display is yellow, the pump is running (for example Low-level signal).
Stroke signal	Stroke signal	It signals each full stroke.
Pump dosing	Pump dosing ⁶⁾	The pump is running and dosing.
Pulse input	Pulse input	It signals each incoming pulse from pulse input.
Bus control	Bus control	It is activated by a command in the bus communication. See section Communication (only DDA-C).
	Timer cycle	The timer can be set in menu: on-time, cycle-time, start delay (only DDA-C).
	Timer week	The timer can be set in menu: procedure, on-time, start time and weekdays (only DDA-C).

Signal		Description
Relay 1	Relay 2	
Contact type		
NO ⁶⁾	NO ⁶⁾	Normally Open Contact
NC	NC	Normally Closed Contact

⁶⁾ Default setting

For the DDE-PR control variant:

Signal		Description
Relay 1	Relay 2	
Alarm ⁷⁾		It signals empty tank or blocked motor.
	Low level ⁷⁾	The level is low in the tank.
	Stroke signal	It signals each full stroke.
	Pulse input	It signals each incoming pulse from pulse input.
Contact type		
NO ⁷⁾	NO ⁷⁾	Normally Open Contact
NC	NC	Normally Closed Contact

⁷⁾ Default setting

Related information

[Communication](#)

Analog output

This section applies to the DDA-C.

In addition to the analog input (operation mode: analog 0/4-20 mA), the pump is also equipped with an analog 0/4-20 mA output signal. Depending on the process control requirements, the following analog output settings are available:

Setting	Description of analog output signal	Control variant	
		FCM	AR
Output = Input	Analog feedback signal (not for master-slave application): the analog input signal is mapped 1:1 to the analog output.	X	X
Actual flow	Flow is measured in the dosing head. (See section Flow measurement.)	X	X ⁸⁾
Backpressure	Backpressure is measured in the dosing head. (See section Pressure monitoring.)	X	
Bus control	It is set by a command in the bus communication. (See section Communication.)	X	X

⁸⁾ Output signal is calculated based on motor speed and pump status (target flow rate).

The analog input and output are calibrated in the factory. As a rule, they do not need to be recalibrated. If necessary, it is possible to calibrate analog input and output via **Advanced settings** in the **Grundfos GO** application.

Key lock and mechanical lock

For the DDA-C and the DDC:

To protect the pump from maloperation, a key lock can be set by entering a 4-digit PIN code. When the pump is locked, it is still possible to navigate through the menus Alarm and Info, and to acknowledge alarms. For the DDA-C, it is also possible to acknowledge alarms in the **Events log** menu, and check the settings in the **Settings** menu.

Two levels of protection are available:

- Settings: the start/stop key and 100% key are still available.

- Settings + keys: the start/stop key and 100% key are also locked.

For temporary (2 minutes) or final deactivation, the 4-digit preset PIN code has to be entered again.

For the DDE:

The adjustment knob can be locked with a locking screw to fix the current setting.

Basic settings

This section applies to the DDA-C and DDC.

For the DDA-C:

With **Factory reset**, the pump can be reset to the default settings. In addition, with **Store settings**, the current configuration of the pump is stored and can be restored later by **Recall settings**. The latest saved configuration is stored in the memory.

In the **Grundfos GO** app, the following options are available:

- **Store settings in GO:** The current pump configuration is saved to the memory in Grundfos GO.
- **Store settings on pump:** The current pump configuration is saved to the memory of the pump.
- **Restore settings:** All settings are reset to the stored settings.
- **Factory reset:** All settings are reset to the factory settings.

For the DDC:

With load factory settings, the pump can be reset to the default settings. In addition, with save customer settings, the current configuration of the pump is stored and can be restored later by load customer settings. The latest saved configuration is stored in the memory.

Units

This section applies to the DDA-C and DDC.

It is possible to select metric units (liter/milliliter/bar) or US units (US gallons/psi). Depending on the operation mode and menu, the following units are displayed:

Operation mode/Function	Metric units	US units
Manual control	ml/h or l/h	gph
Pulse control	ml/pulse	ml/pulse
Analog 0/4-20 mA control	ml/h or l/h	gph
Batch control (pulse- or timer-based)	ml or l	gal
Calibration	ml	ml or gal
Volume counter	l	gal
Pressure monitoring	bar	psi

Additional display

This section applies to the DDC.

The additional display provides additional information about the current pump status. The value is displayed with the corresponding symbol.

In **Pulse** mode, the target flow information can be displayed, for example, Q = 1.28 l/h.

TM048167

Pos.	Description
1	Additional display

The additional display can be set as follows:

Setting	Description
Default display	Q Target flow (Pulse)
	→ Input current (Analog) ⁹⁾
Dosed volume	V Dosed volume since last reset

⁹⁾ Only DDC-AR control variant

FlowControl

This section applies to the DDA FCM-C control variant.

TM088205

DDA-C with FlowControl

The pump monitors the dosing process of liquids when the FlowControl function is activated. While the pump operates, some influences, such as air bubbles, may cause reduced flow rates or even stop the dosing process. For optimal process safety and reliability, the activated FlowControl function immediately detects and displays the following malfunctions:

- overpressure
- discharge line burst
- air bubbles in the dosing head
- cavitation at the suction side
- suction valve leakage
- discharge valve leakage.

The unique FlowControl is based on an intelligent and maintenance-free sensor integrated in the dosing head. During the dosing process, the sensor measures the actual pressure and sends the measured value to the microprocessor in the pump. An internal indicator diagram is generated combining the actual pressure value with the diaphragm position (stroke length). The dosing process is monitored so the different malfunctions can immediately be detected due to their specific deviations in the curve. Compressible air bubbles, for instance, reduce the discharge phase and the stroke volume.

The sensitivity and delay of the FlowControl function can be adjusted individually.

FlowControl requires a minimum backpressure of 2 bar. Grundfos recommends an additional spring-loaded valve (approx. 3 bar) on the discharge side for dosing low capacities, that is, below 1 l/h.

TM041610

Indicator diagram

Pos.	Description
p	Pressure
S	Stroke length
1	Compression phase
2	Discharge phase
2a	Trouble-free dosing stroke
2b	Air bubbles disturbing the dosing stroke
3	Expansion phase
4	Suction phase

Pressure monitoring

This section applies to the DDA FCM-C control variant.

The integrated pressure sensor measures the actual pressure of the system which is shown in the display. A maximum pressure can be set. If the pressure in the system exceeds the set maximum, for example, if there is a closed valve, the pressure monitoring function stops the dosing process immediately. As soon as the backpressure falls below the set maximum, the dosing process continues. In case the pressure drops below the minimum limit, for example, if a discharge line bursts, the pump stops and major chemical spills are prevented.

Pressure setting range

Pump type	Min. pressure [bar] ¹⁰⁾	Max. pressure [bar] ¹¹⁾
DDA 7.5-16	2-16	3-17 (default)
DDA 12-10	2-10	3-11 (default)
DDA 17-7	2-7	3-8 (default)
DDA 30-4	2-4	3-5 (default)

¹⁰⁾ It can be either set as a warning (pump keeps running) or as an alarm (pump stops).

¹¹⁾ The adjustable maximum pressure is equivalent to the maximum operating pressure plus 1 bar.

Flow measurement

This section applies to the DDA FCM-C control variant.

The pump can precisely measure and display the actual dosing flow. Via the analog 0/4-20 mA output, the actual flow signal can easily be integrated in any process control system without any additional measurement equipment.

The Flow measurement function is based on an indicator diagram, see section FlowControl. Accumulating the length of each discharge stroke phase and multiplying it with the stroke frequency results in the actual flow displayed. Malfunctions, such as air bubbles or lower backpressure, result in a reduced or increased actual flow rate. When the AutoFlowAdapt function is activated, the pump compensates these influences by correcting the stroke speed. See section AutoFlowAdapt.

Related information

[FlowControl](#)

[AutoFlowAdapt](#)

AutoFlowAdapt

This section applies to the DDA FCM-C control variant.

When activating the AutoFlowAdapt function, even environmental changes are compensated so that the required target flow rate is achieved. The integrated AutoFlowAdapt makes additional monitoring and control devices redundant. The AutoFlowAdapt function is based on the following factors:

- FlowControl: malfunctions are detected.
- Pressure monitoring: system pressure changes are detected.
- Flow measurement: deviations in the target flow are detected.

Examples:

- FlowControl detects air bubbles in the system. Due to a special motor drive strategy and a certain speed increase, the pump tries to keep the flow rate constant. This is especially important when dosing degassing liquids.
- In general, increasing system pressure reduces the stroke volume whereas falling system pressure increases the stroke volume. The AutoFlowAdapt function compensates for this by automatically and continuously adapting the motor speed. Despite fluctuating system pressure, dosing accuracy is maintained.

New functions in the DDA-C

Max. capacity

This function offers the possibility of reducing the maximum pump capacity for all operation modes and functions. If **Max. capacity** is set, the pump cannot operate at a higher capacity than the set maximum capacity. **Max. capacity** does not affect the function of the 100% button.

The default maximum capacity is the nominal flow of the pump.

Stop after power failure

The **Stop after power failure** function is used to prevent the pump from performing a reference movement and start dosing when the power supply is switched on or re-established after a power failure.

A reference movement is performed every time the power supply is switched on. With the reference movement, the pump identifies the exact diaphragm position to ensure accurate dosing. Depending on the initial diaphragm position, the reference movement can dose a small amount of dosing medium into the process. To avoid this, the **Stop after power failure** function can be enabled.

The function is disabled by default.

When the function is enabled:

- The pump stops and displays an alarm when the power supply is switched on. The pump performs the reference movement after the user acknowledges the alarm.
- Functions which require the reference movement are deactivated until the reference movement is performed. These functions are the following:
 - **Auto deaeration**
 - **FlowControl**
 - Moving the diaphragm into service position
 - Volume counter.

Communication

The pump can be integrated into various bus systems and configured via Bluetooth with the Grundfos GO app. Several communication options are available for remote configuration of the pump:

- **Bluetooth** with the Grundfos GO app
- **Bus/ Cloud control** with a CIM module
- **GENIbus** with **Modbus RTU** protocol
- **Ethernet RJ45** with **Modbus TCP** protocol

With the **Grundfos GO** app, it is possible to change the name of the pump and to manage software updates.

Manuals, functional profiles and support files, such as GSD-files, are available on Grundfos Product Center at www.grundfos.com.

Legacy screen and Dashboard screen

Status information, such as dosing flow, selected operation mode and operating state, is displayed on the **Legacy screen** or the **Dashboard screen**.

TMO88256

TMO88257

Legacy screen with Dashboard screen icon

Dashboard screen with Legacy screen icon

In the **Settings > Display > Mult. display** menu, select 1 to 3 additional values. If **Dashboard screen** is selected, the screen is split. By turning the click wheel and selecting the **Legacy screen** icon in the top bar, the display switches back to the **Legacy screen**. As long as the **Dashboard screen** is active, the **Legacy screen** icon is visible in the top bar.

ConditionCheck

With the **ConditionCheck** function, an analysis of the pump and the system where the pump is installed is performed. During the analysis, a progress bar is shown.

4. Construction

DDA-C and DDC

TM086941

Sectional drawing, DDA-C

TM041533

Sectional drawing, DDC

Construction

The DDA-C and DDC pumps are motor-driven diaphragm dosing pumps consisting of the following main parts:

Dosing head: It has a patented design with a minimum clearance space optimized for degassing liquids. It is supplied with integrated de-aeration valve for priming and venting, complete with connection for a 4/6 mm or 0.17" x 1/4" tubing. DDA FCM-C pumps have an integrated pressure sensor in the dosing head.

Valves: The double-ball discharge and suction valve¹⁶⁾ design allows for less clearance space, which is optimal for degassing liquids. Spring-loaded valves for higher viscosities are available as an option.

Connections: The robust and easy-to-use connection packages are optimal for various sizes of tubing or pipes.

Diaphragm: The full PTFE diaphragm is designed for long life and universal chemical resistance.

Flange: The flange is offered with separation chamber, safety diaphragm and drain hole.

Drive unit: It has a positive return crank with patented noiseless spur gear drive, energy recovery spring for high efficiency (only DDA-C) and stepper motor, all mounted in a robust gear housing.

Control cube: It contains operation electronics with display, keys, click-wheel and protective cover.

Housing: It contains drive unit and power electronics with robust signal sockets. The housing can be clicked on the mounting plate.

³⁵⁾ The installation set includes: 2 pump connections, a foot valve, an injection unit, 19.68 ft (6 m) of PE discharge tube, 6.56 ft (2 m) of PVC suction tube, 6.56 ft (2 m) of PVC de-aeration tube 0.17" × 1/4" (4/6 mm).

³⁶⁾ It is also available in **FCM-C** control version.

³⁷⁾ Only maximum 150 psi (10 bar) for the PVC dosing head.

Installation kits for dosing pumps

An installation kit includes the following parts:

- injection unit with spring-loaded non-return valve, see section Injection units
- PE discharge tube, 19.7 ft (6 m)
- PVC suction tube, 6.5 ft (2 m)
- PVC de-aeration tube, 6.5 ft (2 m)
- PE foot valve with strainer and weight, without or with level indication, see section Foot valves FV.

Foot valves FV

Foot valves are installed at the lower end of the suction tube. They are available either without level indication or with low-level and empty-tank indication.

Foot valves include:

- weight
- strainer (mesh size approx. 0.03 in. [0.8 mm])
- non-return valve
- tube connection set: 1/4", 3/8", 1/2"
- pipe connection set: threaded, 1/4" NPT, female (stainless steel).

Foot valves with low-level and empty-tank indication additionally include:

- reed-switch unit with two floaters
- 16.4 ft. (5 m) of cable with PE jacket
- M 12 plug to connect DDA, DDC, or DDE dosing pump
- PE cap, Ø2.28 in. (58 mm), for assembly in Grundfos cylindrical tanks, or for use with tank adapters.

The contact type of the low-level and empty-tank indication is factory-set to NO. The contact type can be set to NC by turning the floaters upside down.

Electrical data of the level indication:

- max. voltage: 48 V
- max. current: 0.5 A
- max. load: 10 VA.

TM085698

Foot valves: without level indication (left), with level indication (right)

Rigid suction lances RSL

Grundfos offers a comprehensive range of rigid suction lances for a variety of chemical containers.

Rigid suction lances are installed at the lower end of the suction tube. They are available either without level indication or with low-level and empty-tank indication. Their immersion depth is adjustable.

Rigid suction lances include:

- strainer (mesh size approx. 0.3" [0.8 mm])
- non-return valve
- tube connection set: 1/4", 3/8", 1/2"
- adjustable tank connection with holes, for example, relief line.

Rigid suction lances with low-level and empty-tank indication additionally include:

- reed-switch unit with 2 floaters
- 16.4 ft. (5 m) of cable with PE jacket
- M 12 plug to connect DDA, DDC, or DDE dosing pump.

The contact type of the low-level and empty-tank indication is factory-set to NO. The contact type can be set to NC by turning the floaters upside down.

Electrical data of the level indication:

- max. voltage: 48 V
- max. current: 0.5 A
- max. load: 10 VA.

Emission protection kits

Gas emitted by liquid in a container can cause bad odor and corrosion. Emission protection kits help avoid such problems. Rigid suction lances can be retrofitted with emission protection kits.

Two variants are available:

- Emission protection kit with snifting valve: no gas can escape from the container, but air can be drawn in.
- Emission protection kit for use with filter: gas can escape from the container and air can be drawn in. The kit can be connected to a filter by a 0.17x1/4 (4/6 mm) tube.

Emission protection kits include:

- gasket for the tank adapter
- snifting valve or tube nipple 0.17x1/4 (4/6 mm) (tube is not included)
- gasket for the cable outlet.

Injection units

Injection units connect the dosing line with the process line. They ensure a minimum counterpressure of 10 psi (0.7 bar) bar and prevent backflow of the dosing liquid.
In general, they include the following:

- injection pipe (PP, PVC and PVDF versions can be shortened)
- spring-loaded non-return valve with Tantal spring
- tube connection set (PP, PVC, PVDF): 1/4", 3/8", 1/2"
- pipe connection set: threaded, 1/4" NPT, female (stainless steel).

Hot-injection units with ball valve

Hot-injection units with ball valve can be used for direct injection of the dosing medium into processes with a high process water temperature of up to 248 °F (120 °C). Hot-injection units have a stainless-steel injection pipe and a bendable stainless-steel cooling pipe of 1 meter. The stainless-steel ball valve is installed between the injection pipe and the cooling pipe. The cooling pipe separates the hot parts from the non-return valve and the dosing line.

Multi-function valves, pressure-relief valves, pressure-loading valves

Multi-function valves combine the functions of pressure-relief valves and pressure-loading valves. In addition, they allow de-aeration of the pump and emptying of the discharge line for maintenance.

Pressure-relief valves protect the pump and the discharge-side installations against excessive pressure. All pressurized dosing installations should include a pressure-relief valve.

Pressure-loading valves maintain a certain counterpressure for the dosing pump.

They are used in the following cases:

- If the counterpressure is too low or there is no counterpressure at all.
- There is fluctuating system pressure with discharge-side pulsation damper.
- To prevent syphoning when the inlet pressure is higher than the counterpressure.

TM086554

Multi-function valve, pressure-relief valve, pressure-loading valve

Multi-function valves

A multi-function valve is mounted directly on the pump discharge side. The top connection is for the discharge line, the side connection leads the relief liquid back into the tank.

- Loading pressure, adjustable from 15 to 58 psi (1 to 4 bar), is factory-set to 44 psi (3 bar).
- Relief pressure, adjustable from 101 to 232 psi (7 to 16 bar), is factory-set to 145 or 232 psi (10 bar or 16 bar) .
- Maximum operating pressure: 232 psi (16 bar).
- Tube connection set: 1/4", 3/8", 1/2" .

[Pump connection kits and inlay kits](#)

Pressure-loading valves PLV

Pressure-loading valves are installed in the discharge line after the pressure-relief valve, and after the pulsation damper, if fitted.

- Loading pressure, adjustable from 15 to 73 psi (1 to 5 bar), is factory-set to 44 psi (3 bar).
- Maximum operating pressure: 232 psi (16 bar).
- Tube connection set: 1/4", 3/8", 1/2" .
- Pipe connection set: threaded, 1/4" NPT, female (stainless steel).

Pressure valves

Pressure valves provide a constant counterpressure of 44 psi (3 bar). They are particularly required for the DDA FCM-C pumps at very small flow rates.

Pressure valves are installed either directly on the pump discharge side, or on the pressure-relief valve.

- Loading pressure: 44 psi (3 bar), not adjustable.
- Maximum system pressure: 232 psi (16 bar).
- Spring material: Alloy C-4 (NiMo16CrTi, material number 2.4610).
- No connections included.

Pump connection kits and inlay kits

Retrofit pump connection kits and inlay kits are available for the integration of Grundfos standard dosing pumps into installations with various sizes of tubes or pipes.

A pump connection kit includes the following:

- 1 set of inlays
- 1 union nut.

The inlay kits are used for connecting pumps and accessories to pipes or tubes that differ from Grundfos standard sizes.

An inlay kit includes the following:

- 2 sets of inlays.

Adapters

Threaded adapters

Threaded adapters are used for converting between different threaded connection sizes.

A threaded adapter kit includes the following:

- 1 adapter
- 1 O-ring.

Dosing tanks

Square tank, 26 gal (100 l)

The closed square tank has a screw cap and a mounting platform for one pump or two pumps in parallel.

The pump mounting platform is higher than the screw cap to protect pumps and connections when filling chemicals into the tank.

Characteristics of the tank:

- tank material: MDPE
- weight: 33 lbs (15 kg)
- wall thickness: 0.15 (4 mm)
- liquid temperature: -4 °F to 113 °F (-20 °C to 45 °C).

SMART Digital S pumps can be fitted directly on the mounting platform by brass inserts molded into the platform. For other pumps, a bracket is required.

The square tank is prepared for a G 3/4" drain valve.

When using a rigid suction lance in the tank, choose the counter nut for fixing, see section Adapters for containers.

Cylindrical tanks

Dosing tanks are intended for storing and dosing liquids. Different tank accessories can be mounted directly to the tank. Cylindrical tanks are available in transparent or black. They have a liter scale and a black screw cap.

Characteristics of the tank:

- Tank volume: 11-264 gal (40-1000 l)
- tank material: LLDPE, UV-stabilized
- liquid temperature: -4 °F to 113 °F (-20 °C to 45 °C).

All cylindrical tanks are prepared for a G 3/4 opening for a drain valve, and have a screw plug (PE or EPDM).

The cylindrical tanks with volumes of 16, 26, 53, 79, and 132 gal (60, 100, 200, 300, and 500 l) additionally include the following:

- threaded M 6 inserts for the direct assembly of a dosing pump
- G 2 opening for a rigid suction lance or a foot valve, closed with a screw plug
- threaded M 6 inserts at the bottom part for floor mounting with a set of floor-mounting brackets
- flange for an electric stirrer with threaded inserts.

The cylindrical tanks with volumes of 16, 26, 53, 79, 132, and 264 gal (60, 100, 200, 300, 500 and 1000 l) can optionally be prepared for direct assembly of an electric stirrer:

- with opening for electric stirrer (16-132 gal [60-500 l])
- with opening and reinforced beam for holding an electric stirrer (264 gal [1000 l]).

9. Pumped liquids

The resistance table below is intended as a general guide for material resistance (at room temperature), and does not replace testing of the chemicals and pump materials under specific working conditions.

The data shown are based on information from various sources available, but many factors, such as purity, temperature, abrasive particles, may affect the chemical resistance of a given material.

Some of the liquids in this table may be toxic, corrosive or hazardous. Be careful when handling these liquids.

● = Resistant

○ = Limitedly resistant

- = Not resistant

48) Once the pump stops, calcium hydroxide sediments rapidly.

49) There is risk of crystallisation.

50) It reacts violently with water and generates much heat. (The pump should be absolutely dry before dosing Sulfuric acid.)

10. Grundfos Product Center

Online search and sizing tool to help you make the right choice.
From the international view, you can select your specific country to view the product range available to you.
International view: <https://product-selection.grundfos.com>

All the information you need in one place

Performance curves, technical specifications, pictures, dimensional drawings, motor curves, wiring diagrams, spare parts, service kits, 3D drawings, documents, system parts. The Product Center displays any recent and saved items - including complete projects - right on the main page.

Downloads

On the product pages, you can download installation and operating instructions, data booklets, service instructions, etc., in PDF format.

When you select your country, you see the menus below. Note that some menus may not be available depending on the country.

Example: <https://product-selection.grundfos.com/uk>

Pos.	Description
1	Products & services enables you to find products and documents by typing a product number or name into the search field.
2	Applications enables you to choose an application to see how Grundfos can help you design and optimize your system.
3	Products A-Z enables you to look through a list of all the Grundfos products.
4	Categories enables you to look for a product category.
5	Liquids enables you to find pumps designed for aggressive, flammable or other special liquids.
6	Product replacement enables you to find a suitable replacement.
7	WWW enables you to select the country, which changes the language, the available product range and the structure of the website.
8	Sizing enables you to size a product based on your application and operating conditions.
